

## AFTER VISIT SUMMARY

Akshay R. Margam DoB: 8/31/2001 Date: 7/23/2025

Barnes-Jewish Hospital Emergency Department 314-362-9123

### Instructions

Keep the wound clean and dry for 24 hours, afterwards you may rinse gently with soap and water and pat dry. Do not submerge the wound under water such as with swimming or taking a bath. The wound was left open to allow it to heal slowly. Surgery would like to see you in one week to follow up on the wounds healing. Please take the antibiotics to help prevent infection. Scar massage after initial healing and sunscreen over the scar can help minimize the final scar visibility, though you will most likely have a visible scar for life. Take tylenol and ibuprofen for pain. This is most effective when you alternate medications every 3 hours (take tylenol, wait three hours then take ibuprofen, wait three hours take tylenol again).

If you develop fever >101F, pus discharging from the wound, spreading redness around the wound or other concerning symptoms, you may be developing a wound infection and should return to your doctor or the ER as soon as possible.]

Your medications have changed

Start taking:  
amoxicillin-clavulanate (AUGMENTIN)

Review your updated medication list below.

Pick up these medications from any pharmacy with  
your printed prescription  
amoxicillin-clavulanate

### Today's Visit

### **Emergency Department Procedural Sedation Discharge Instructions**

You have undergone "procedural sedation."

This procedure is used so that patients may undergo very painful procedures such as fracture repairs, dislocation repairs, and spinal taps, with minimal discomfort and virtually no memory of the event.

During the procedure, you were given medication to make you very sleepy and medication for pain control. Often patients cannot remember what happened during the procedure. This is a very desirable effect of the medication.

During the procedure, nurses and doctors monitored your vital signs (blood pressure, heart rate, and respiratory rate), and the amount of oxygen in your blood.

Before you go home, your doctors and nurses will make sure that you are awake enough to go home safely.

#### **Effects of Sedation**

- Drugs can stay in body up to 24 hours
- May feel drowsy, sleepy, dizzy, light headed or nauseated
- May have headache
- May have brief memory loss

#### **Sedation Precautions**

- Do not drive, operate equipment, drink alcohol, smoke, make important legal decisions or sign any legal document for at least 24 hours

#### **Emergency phone number**

- Call 911 if you have an emergency

#### **Activity Restrictions**

- Careful when standing, changing positions, walking, climbing stairs
- Resume normal activities slowly
- Go back to regular work or exercise as directed by physician

#### **Dietary Restrictions**

- Slowly progress from liquids to a light meal as directed by physician

#### **Medications**

- Take medications and herbal supplements as directed by physician
